

Drying Retarder

Description:

The drying retarder is a special additive for water varnishes. It prolongs the drying period of water-based varnishes if the ambient temperature is higher and/or air humidity is low. Using the retarder reduces the risk of the varnish drying too quickly, which may lead to such faults as "orange skin" or roller marks.

Use:

- Supramal 1K topcoat water varnish, matt and semi-gloss.
- Supramal 2K topcoat water varnish, matt and semi-gloss.

Application conditions:

Room temperature > 22°C
and / or
relative air humidity < 50%.

Procedure:

Add 4 % max. of drying retarder (up to 200 cm³ for a 5L can) and mix thoroughly. For 2K varnishes, add drying retarder after adding the hardener.

Colour:

Colourless

Storage time and conditions:

12 months of the production date in a temperature above 5°C.

Packaging:

0.4L plastic container.

The effectiveness of our systems results from laboratory research and many years of experience. We ensure high quality, provided the user follows the instructions and the work is performed in accordance with good construction practices. We may not be held liable for defects if final results were affected by factors beyond our control.
